Ollama and Qwen installation

Instructions

- Download Ollama from here: https://ollama.com/download
- Install it.
- Check that Ollama is installed by running the following in Terminal / Command Prompt / PowerShell window:

```
ollama --version        # You will see the Ollama version installed on your computer
```

- Open a Terminal / Command Prompt / PowerShell window and run:

```
ollama run qwen3:8b
```

- After the above command, Ollama will first download the model. This will take some time.
- Once the Qwen model is downloaded, you will see a chat prompt in the terminal

Interact

- In the Ollama chat window, type

`Reply with exactly: My local model is working.`

- You should get a response from the Qwen model
- Exit the Ollama chat by using either **`Ctrl + D`** or typing **`/bye`**
- Open the Terminal / Command Prompt / Powershell window and run:

`ollama list`

This command will list the models installed on your computer. You should see **`qwen3.8b`**

Now, run the command **`ollama run qwen3:8b`** again.

This time everything will seem to run faster, because the first time, Ollama had to download the model. Now, it's already there

Test Ollama

- In the same Terminal / Command Prompt / Powershell window and run:

`http://localhost:11434`

- This is the API on your machine with which you can use any model downloaded via Ollama

Python connection

- Create a new folder and virtual environment in your VS Code or any IDE you are using.
  - Remember the steps you used earlier in the class.
- Then in the IDE terminal, type

```
uv pip install ollama
```

- Then create a small Python file called **test_ollama.py,**

```
from ollama import chat
response = chat(
    model="qwen3:8b",
    messages=[
        {
            "role": "user",
            "content": "Reply with exactly: Python can talk to Qwen."
        }
    ]
)
print(response.message.content)
```

Python connection (ctd.)

- Then run the file:

```
uv run python test_ollama.py
```

You should get a response from Ollama

What you just did

- You used a Python program to connect to an LLM via Ollama and interacted with it.
- Your project will work in a somewhat similar way
- This was just for practice.
- You don't have to submit anything else.

That’s all for this practice
